

IPv4 Consumption and transition to IPv6

LACNIC Campaign Latinamerica and the Caribbean in IPv6 1/1/11

Haiti, August 2008

Agenda

- ◆ **Initial concepts.**
- ◆ **Why IPv6?**
- ◆ **IPv4 Runout Policies.**

Some initial concepts.

- ◆ **IPv6 is the evolution of IPv4, the most successful network protocol of the history.**
- ◆ **IPv4 and IPv6 are not “compatibles on the wire”, which means an IPv4 only host can’t communicate with an IPv6 only host by themselves.**
- ◆ **IPv6 will not substitute IPv4, both protocol will co-exists for several years. Just like IPX is still existing in your networks. There won’t be an “IPv4 Blackout”.**

IPv6 Advantages

- ◆ **Many more addresses:**
340,282,366,920,938,463,374,607,431,768,211,456 available addresses.
- ◆ **It makes simpler IPv4 tasks:**
 - ◆ Auto-configuration.
 - ◆ Renumbering.
 - ◆ Security (IPSEC).
 - ◆ Multicast.
 - ◆ IP Mobility.
- ◆ **Innovation.**
- ◆ **Efficiency.**

¿Why do we need a new network protocol?

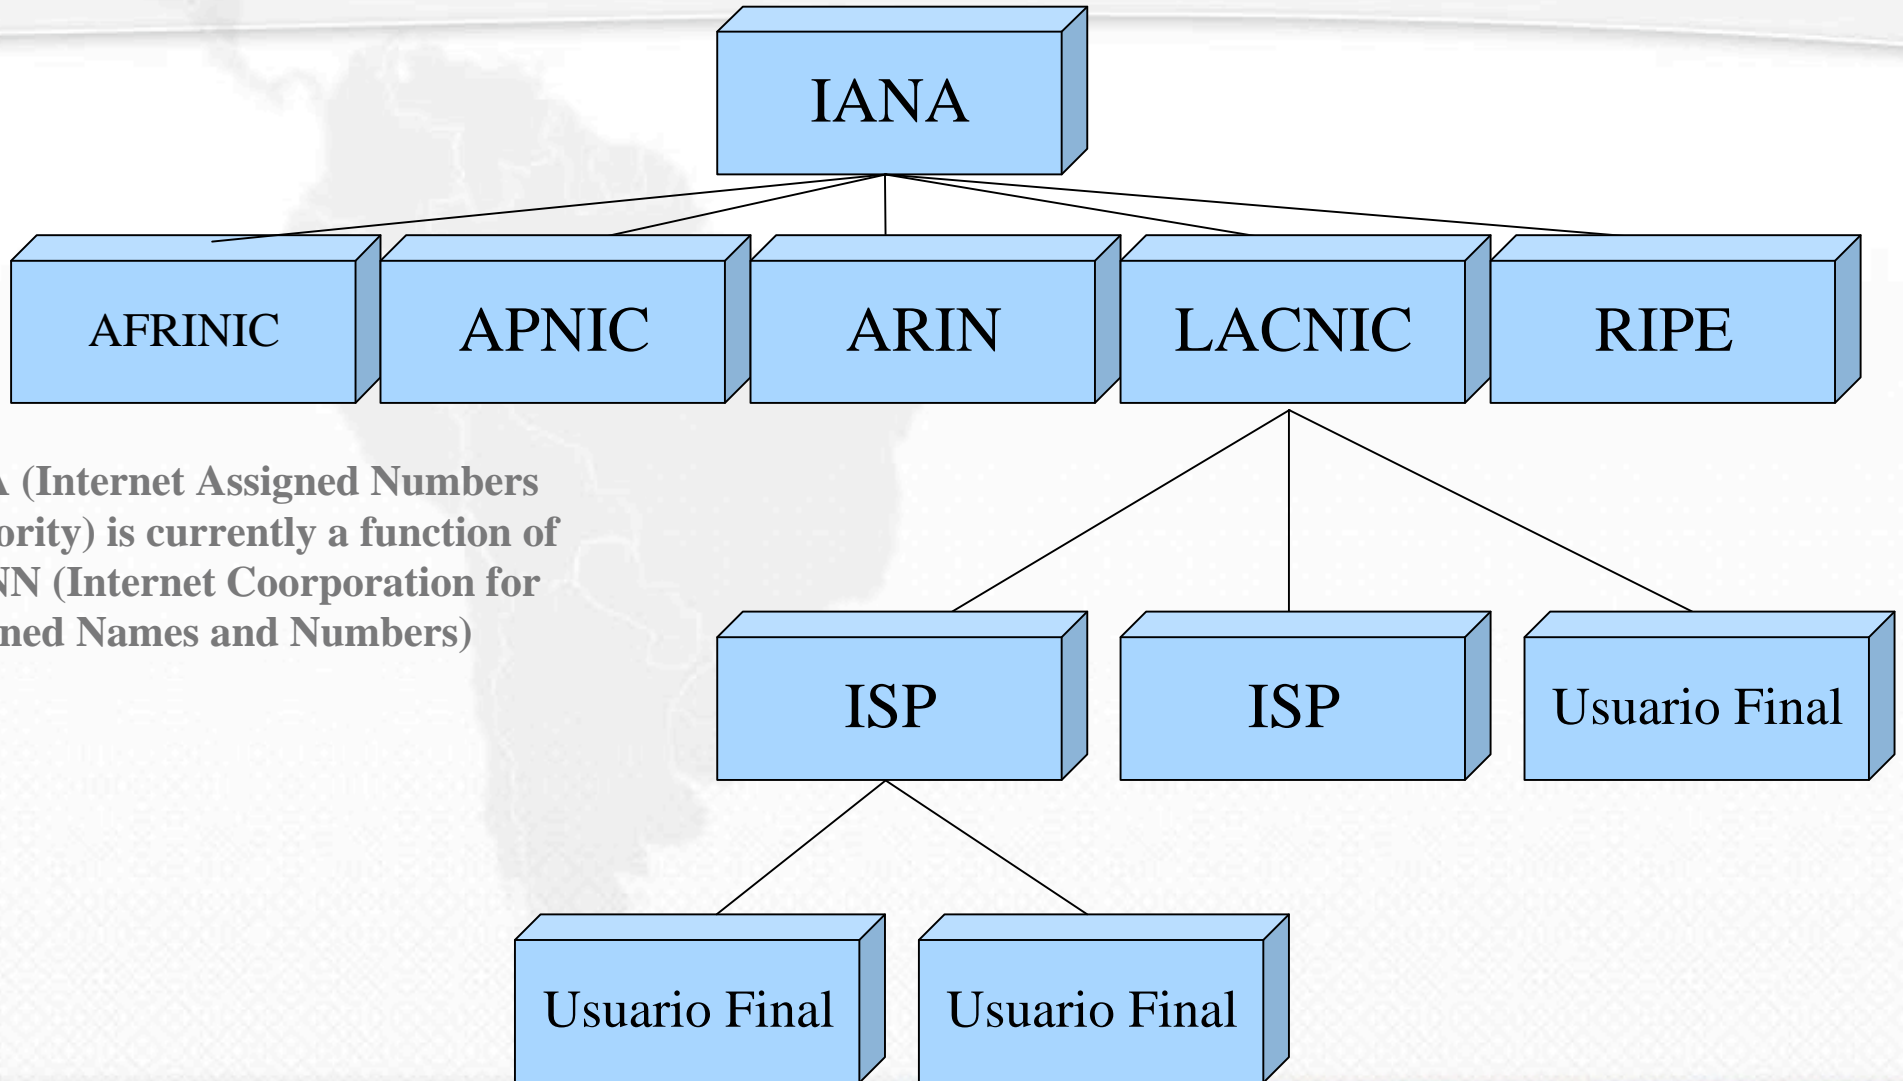

We need more addresses!

- ◆ **Thousand of millions “always on” users.**
- ◆ **More divises to connect: cell phones, PDA, games consoles, etc.**
- ◆ **New applications: Home control, sensor networks.**
- ◆ **New broadband technologies: Wimax, DOCSIS 3.0, etc.**

Internet Number Resources Distribution

IANA (Internet Assigned Numbers Authority) is currently a function of ICANN (Internet Corporation for Assigned Names and Numbers)

Regional Internet Registries

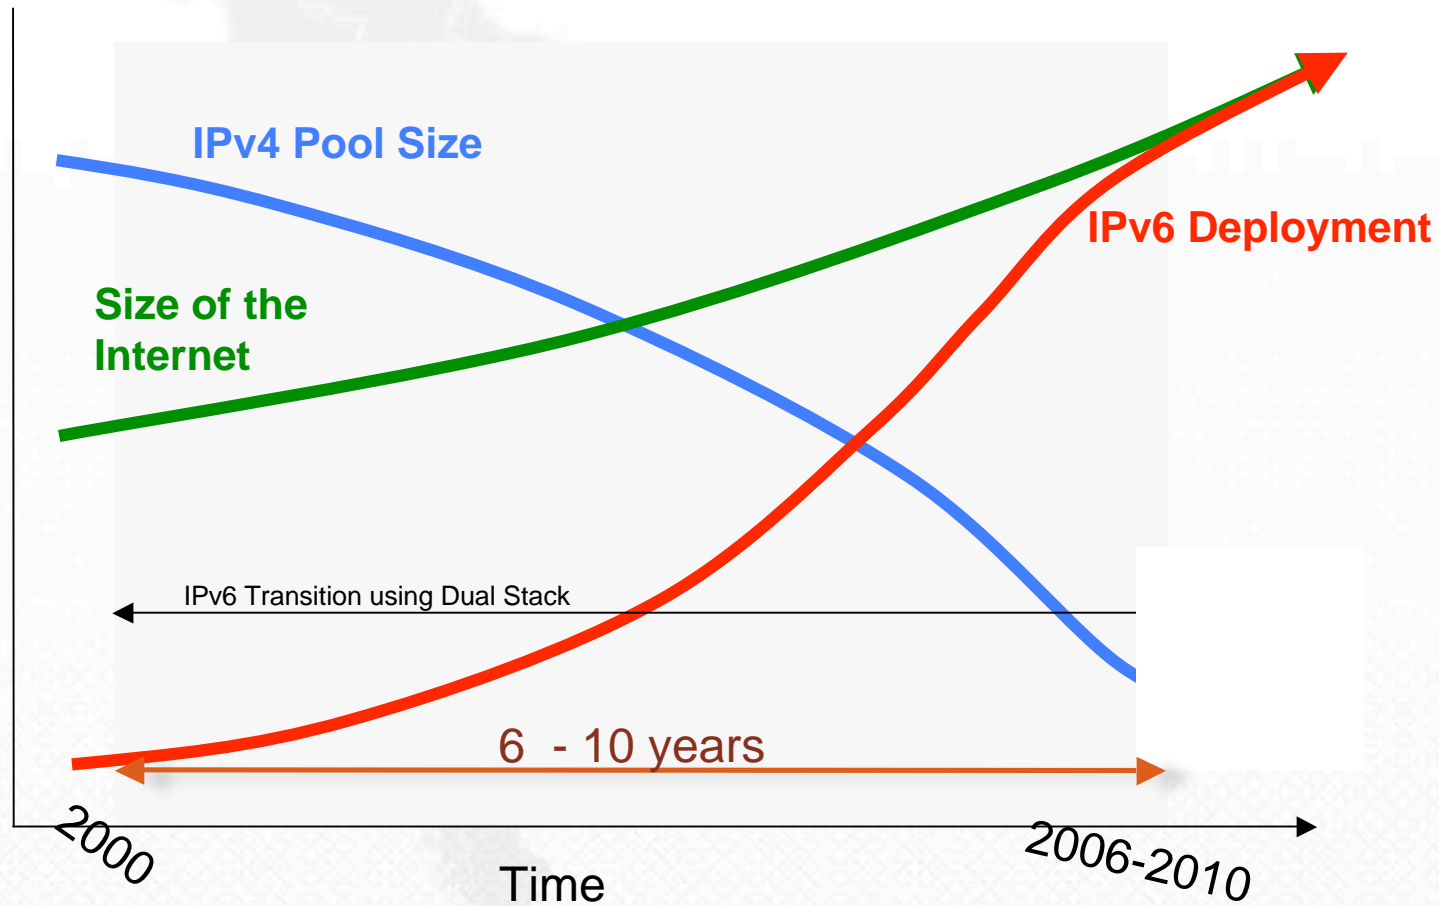

IPv4 Run-out

- ◆ IPv4 has 4.3 billions available addresses.
- ◆ Initial allocations did not considered the success of the network.
- ◆ In the early 90s there was already fear about the run-out of IPv4 addresses and worked started on a successor.
- ◆ In 1993, CIDR arrives and then NAT. The end of IPv4 gets postponed.

IPv4 Run-out. The plan 10 years Ago.

From Geoff Huston - RIPE 56.

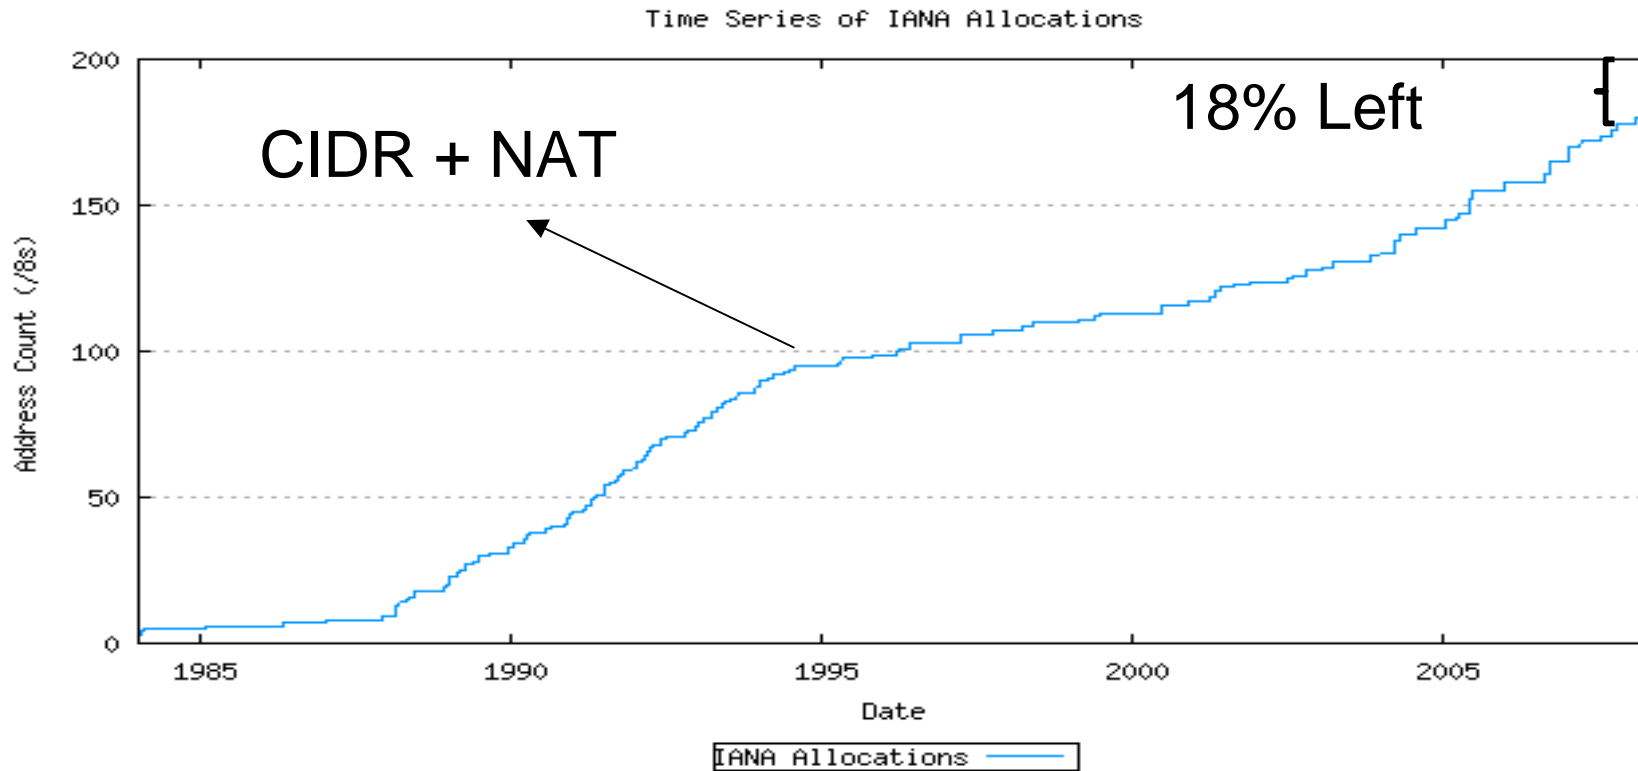

¿What happened then?

- ◆ Thanks to CIDR and NAT the network grew without needing IPv6.
- ◆ The industry did not invest in IPv6.
- ◆ 2000 crisis?
- ◆ So, IPv6 did not flied.

So, ¿What is the problem now? (1)

Central Pool Run-out Forecast : June 2011.

So, ¿What is the problem now? (2)

Other forecasts talk about 2010.

Source: Alain Durand, Comcast.

The new plan...

From Geoff Huston - RIPE 56.

Life After Run-out

Current distribution of IPv4 addresses

Unit: /8.

A /8 = 1/256 of the total IPv4 addresses space.

Stock de IANA

/8 UNITS

What could happen?

- ◆ **There will be IPv4 addresses for many years. (in different ways).**
- ◆ **Difficulties for allocating big (and not so big) contiguous blocks.**
- ◆ **IPv6 could not be broadly used until IPv4 is exhausted or until there are adequate economic incentives.**
- ◆ **At some point, there could be “only IPv6” users.**
- ◆ **NAT Use Increases**
- ◆ **Secondary/Gray Market**

Reflections

- ◆ IPv6 will not replace IPv4 neither in the short term nor in the midterm. Both protocols will coexist for many years.
- ◆ The policies for receiving IPv6 addresses are not an obstacle. Neither the associated costs. They aim to facilitate IPv6 adoption.
- ◆ IPv6 is ready for its utilization. As any other technology, it is something live that will be improved along the time. But it is ready.
- ◆ Many efforts should be focused in promotion and training.
- ◆ It is also a very good opportunity for innovation.

Policy discussion

- ◆ **There are several proposal being discussed in the RIRs' open policy forums.**
 - ◆ To encourage adoption of IPv6
 - ◆ For facilitating the transfer of IPv4 addresses between organizations.
 - ◆ For distributing one part of the remaining unallocated pool.
 - ◆ For ensuring IPv4 addresses to new entrants.
- ◆ **Any adopted or rejected proposal has impact in our communities, and in your businesses.**
- ◆ **Participation is very important.**
 - ◆ Information about how to participate in LACNIC policy development processes is available in the website.

Scenarios

- ◆ **Different possible scenarios based in what measures are taken and what policies are adopted.**
- ◆ **It is not possible to ensure that the access to IPv4 addresses in secondary markets (grey markets) will be equitable.**
- ◆ **There are a lot of things to do, but the most important is to work in IPv6 deployment and adoption.**

Thank you !
Obrigado !
Gracias !
